1 KB-Ecoline Hybrid combination boiler
2 Power supply electrical element 3000 Watt
   230 Vac, generator or solar panel
3 Board network 230Vac 320 Watt
4 Fuel line
5 Fuel tank
6 Flue gas set
7 CH supply
8 CH return
9 Air heater
10 Insulated air hose Ø45mm
11 Towel radiator
12 Hot water shower
13 Distribution block
   underfloor heating
14 5 inch control panel
15 Radiator
16 Kabola Heater controller

OPTION:
App for wifi control

KB-Ecoline Hybrid combiboiler
Underfloor heating distribution block
Air heater
The Kabola zone control is the key to a successful, comfortable and energy-saving climate control for ship, sailboat, camper, motorhome and living environment. Dividing rooms into zones and being able to regulate these on the basis of temperature / comfort requirements, ensures that energy is not unnecessarily used for rooms where no one is present.

The Kabola zone control gives the freedom to adjust the temperature setting for each zone at any desired time. The living spaces at "comfort" temperature, when used, the bedrooms at "minimal" or not heating in absence and a desirable temperature at bedtime. And the study or shower on "comfort" whenever you want. In short, it is all possible and is super easy to operate.

Home earlier? No problem! With a simple handling, the zone which must be heated quickly is selected directly via the central control panel. There are many functions that are quick, easy and user-friendly to select.

Of course you can also operate remotely via tablet or smartphone. The system can control Kabola hot air blowers in a modulating way and open and close special radiator knobs. Because these knobs can be applied to both radiators and under/ floor heating, almost anything is possible.

The Kabola zone control system is based on 1 touchscreen, on which the room can be selected and also the temperature. Each room gets its own room temperature sensor via the one-line system (so no tangled cables). The hot air blowers also have a hot water sensor. In this way, the blower will not run until really warm air can be blown out and there is no unnecessary energy loss. The blower has a modulating effect, which means that when there is little temperature difference, the blower runs very softly and produces very little noise. If there is a little more heat demand, the blower will turn a little faster. If it has to warm up quickly, it will start working at full speed.

Do you also want to be able to control the temperature in your bedroom? That is possible. The system can be expanded modularly with a separate compact operating display.
